

**AMENDMENTS TO THE CLAIMS:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**LISTING OF CLAIMS:**

Claims 1-12 (canceled).

13. (Currently Amended) A layer system, comprising:

a silicon layer, wherein substantially the entire layer is made of silicon; and  
a passivating layer at least regionally and superficially deposited on the silicon layer, wherein the passivating layer has a substantially inorganic first partial layer and a substantially polymer second partial layer, and wherein the first partial layer is substantially made of an oxide layer, and wherein the first partial layer has a thickness of 1 nm to 100 nm, and wherein the first partial layer is deposited directly on the silicon layer.

14. (Canceled).

15. (Canceled).

16. (Canceled).

17. (Previously Presented) The layer system as recited in claim 13, wherein the second partial layer is substantially made of polytetrafluoroethylene.

18. (Previously Presented) The layer system as recited in claim 16, wherein the second partial layer is substantially made of polytetrafluoroethylene.

19. (Previously Presented) The layer system as recited in claim 17, wherein the second partial layer has a thickness of 30 nm to 800 nm.

20. (Previously Presented) The layer system as recited in claim 18, wherein the second partial layer has a thickness of 30 nm to 800 nm.

21. (Previously Presented) The layer system as recited in claim 13, wherein the passivating layer is a layer protecting the silicon layer against an etch attack by a gaseous halogen fluoride.

22. (Previously Presented) The layer system as recited in claim 17, wherein the passivating layer is a layer protecting the silicon layer against an etch attack by a gaseous halogen fluoride.

23. (Previously Presented) The layer system as recited in claim 13, wherein the passivating layer is free of at least one of microscale and nanoscale channels that are pervious to a gaseous halogen fluoride.

24. (Previously Presented) The layer system as recited in claim 17, wherein the passivating layer is free of at least one of microscale and nanoscale channels that are pervious to a gaseous halogen fluoride.

25. (Currently Amended) ~~The layer system as recited in claim 13,~~ A layer system, comprising:

a silicon layer; and

a passivating layer at least regionally and superficially deposited on the silicon layer, wherein the passivating layer has a substantially inorganic first partial layer and a substantially polymer second partial layer;

wherein, within the passivating layer, at least regionally an intermediate layer situated between the first partial layer and the second partial layer and adjoining both the first and second partial layers is provided, wherein the intermediate layer has a composition such that in a surface area of the intermediate layer adjoining the first partial layer, the intermediate layer has a composition at least approximately similar to the first partial layer, and in a surface area of the intermediate layer adjoining the second partial layer, the intermediate layer has a composition at least approximately similar to the second partial layer, and wherein the intermediate layer transitions, one of continuously and in steps, from the composition at least approximately similar to the first partial layer to the composition at least approximately similar to the second partial layer.

26. (Previously Presented) The layer system as recited in claim 25, wherein the intermediate layer contains silicon, oxygen, carbon and fluorine.

27. (Currently Amended) ~~The layer system as recited in claim 13,~~ A layer system, comprising:

a silicon layer; and

a passivating layer at least regionally and superficially deposited on the silicon layer, wherein the passivating layer has a substantially inorganic first partial layer and a substantially polymer second partial layer;

wherein, within the passivating layer, at least regionally an intermediate layer situated between the first partial layer and the second partial layer and adjoining both the first and second partial layers is provided, wherein the intermediate layer has a composition such that in a surface area of the intermediate layer adjoining the first partial layer, the intermediate layer has a composition at least approximately similar to the first partial layer, and in a surface area of the intermediate layer adjoining the second partial layer, the intermediate layer has a composition at least approximately similar to the second partial layer, and wherein the intermediate layer transitions, one of continuously and in steps, from the composition at least approximately similar to the first partial layer to the composition at least approximately similar to the second partial layer.

28. (Previously Presented) The layer system as recited in claim 27, wherein the intermediate layer contains silicon, oxygen, carbon and fluorine.

29. (Canceled).

30. (Canceled).
